Q: Implementing a function in C How do you implement a function in C? I understand that, for example: `int test(char x){ return x; }` So, to implement a function in C, you need to use parameters. I am trying to understand how to pass a reference to a string. In C++, you use const strings, or you use the string literal: "Hello". In C, I was thinking something like: `const char *x;` But what would the function look like if it takes parameters? A: If you want to pass a reference to a string, like "Hello", you can't pass that as an argument (because string literals are constant and can't be passed around). You would have to make it a global variable, and in that case, it would be initialized to the literal. `int main() { const char *hello = "Hello"; printf("%s ", hello); }` Of course, in this case, you're passing the address of the string literal to the function. In other words, this is very much not recommended. If you're trying to pass a string literal around (like in a function), you should never do this. If you want to pass the contents of a string literal, you can do it in two ways: 1) Allocate a buffer of sufficiently large size 2) Allocate a buffer of sufficient size and copy the literal string to it. See `strdup()` and `strndup()` on how to allocate the buffer. Once done, you can pass the buffer to the function. C is a pass by value language, you cannot pass the contents of a string literal. In C there is no reference to a string. You have to declare a pointer to a character and you can set a variable to that pointer or pass it to a function. `char *string = "Hello"; printf("Hello %s ", string);` If you do not set a variable with a string literal, it will be set with zero. It will allocate a string of length 0. Puzzled over a probability question, please help Let a certain experiment be described as follows 82157476af
